Magnetic Gasket Replacement

Remove the screws from the top corners of the existing gasket (there's one per side). You may have to grab the magnet and move it upwards to expose the screws

Make sure to remove any excess material

Starting at one of the top corners press the dart into the groove in the door leaf that's farthest in from the edge

Work the gasket into the same groove along the top of the door leaf

Do the same for both sides working from the top to the bottom

If the gasket is longer than your door you will have to cut it to length

Cutting the door gasket to length

Cut the gasket flush with the bottom edge of the door leaf

Trim the dart on the back side of the gasket in one inch

Apply super glue in the end of the gasket then press together

Make sure the gasket is completely seated along the top and side of the door

Insert the screws back into the top corners of the door leaf
